Knowing the soil is all the more important due to the fact that food grows in the soil and its quality depends on the health of the soil. There are many problems with fertile soil around the world as conventional methods of farming are destroying it. At the local level, soil knowledge is important for planning the use of land and for self-sufficiency. Therefore is soil geography important for the use of procedures to analyse physical, chemical and biological properties of the soil, for used techniques and interpretation of results as well as developing thinking about how we can take care of our own soil to keep it healthy and adaptable to climate changes. This is especially important because the soil is the basis for plant growth, and the plants are the carrier of biodiversity in the ecosystem. By this we emphasize the responsibility towards the environment, which directly affects the social dimension, i.e. human health and their well-being. And this again affects the economic dimension of sustainability

Key words: agroecology, education, environment, soil geography.
